Abstract

Processes and systems are provided that include introducing ammonia liberated from organic waste to a coal burner in a coal burning power plant, preferably for NO_x removal at the power plant. The ammonia is preferably either ammonia liberated upon drying a mixture of organic waste and coal combustion byproducts or ammonia liberated when organic waste is mixed with coal combustion byproducts and one or more alkaline additives. Also provided are processes and systems of fueling a coal burner of a power plant with coal and either a dried mixture of organic waste and coal combustion byproducts, or a mixture of organic waste, coal combustion byproducts and one or more alkaline additives. The present invention is further directed to mixtures of either organic waste and coal combustion byproducts, or mixtures of organic waste, coal combustion byproducts and alkaline additives made by the processes of the present invention.
